```
{{ count + 1 }}
```

...while this one does NOT:

```
{{ object.id + 1 }}
```

The rendered result will be `[object Object]1` because `object.id` when evaluating the expression and remains a ref object. To fix this, `id` into a top-level property:

```
const { id } = object
```

```
{{ id + 1 }}
```

Now the render result will be `2`.

Another thing to note is that a ref does get unwrapped if it is the final text interpolation (i.e. a `{{ }}` tag), so the following will render `1`:

```
{{ object.id }}
```

This is just a convenience feature of text interpolation and is equivalent to `{{ object.id.value }}`.
